

Arched solar panels

Overview

Flexible solar panels are thinner, lighter, and more versatile than standard solar panels, capable of bending around a corner or over a bump in your roof. That's because they're made of much less substantial silicon sheets than their heavier cousins. While a standard panel's thickness is around 200 micrometres. They're great for off-grid, on-the-move applications – like camping holidays, or for powering your boat – because they're light and can wrap around. The cost of flexible solar panels will depend on whether they're being used to power a house or a vehicle. To help, and give you a better idea of what you can expect to pay, we've broken down the cost by roof size and by vehicle. Flexible solar panels generally last 5-10 years. This is a considerably shorter lifespan than traditional panels, which typically have 25-year warranties, and can often last even longer. Though they work in much the same way as standard panels, there are some key differences. There are two types of flexible solar panels: thin-film panels, and crystalline silicon panels. Thin-film panels are created by printing.
