

Can solar energy be used at minus 20 degrees

Overview

The number one (often forgotten) rule of solar electricity is that solar panels generate electricity with light from the sun, not heat. While temperature won't change how much energy a solar panel absorbs from the sun, it actually can change how much of that energy is converted into electricity. If a solar panel is extremely hot. Inside a hot solar cell, atoms vibrate at a faster rate than when the solar cell is cool. Electrons within the atoms are normally energized to a higher level. Solar panel efficiency drops by around 0.05 percent for every degree Celsius increase in temperature. On the other hand, efficiency increases by 0.05 percent for every degree Celsius decrease in temperature. It's important. The ideal day for a solar panel is actually cold, sunny and windy. Under these conditions, the panel gets plenty of energy from the sun, keeps cool, and the wind sweeps away the normal levels of heat generated within the solar.
