## Overview

A lithium-titanate battery is a modified lithium-ion battery that uses lithium-titanate nanocrystals, instead of carbon, on the surface of its anode. This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the. The lithium-titanate or lithium-titanium-oxide (LTO) battery is a type of which has the advantage of being faster to charge than other but the disadvantage is a much. Titanate batteries are used in certain Japanese-only versions of as well as 's EV-neo electric bike and. They are also used in the concept electric bus. Because of the battery's high level of safety and recharge. • • • • • Log 9 scientific materialsThe Log9 company is working to introduce its tropicalized-ion battery (TiB) backed by lithium ferro-phosphate (LFP) and lithium-titanium-oxide (LTO) battery chemistries. Unlike LFP and LTO, the more popular NMC (Nickel Manganese.
