

Solar Wattage and Voltage

Overview

Because watts is equal to amps x volts, you can calculate amps by dividing watts by volts. If you have a 100W solar panel with a maximum power voltage of 18.6V, the solar panel's max amps will be $100/18.6$, which is 5.3 amps. In real life, however, the amps produced by the solar panel will be slightly lower. Both are important. Amps determine how many watts a solar panel produces. That said, when it comes to sizing solar panels, watts is a more useful measure. That's because it tells you how. If you only have the watts and voltage, you can calculate amps by dividing the watts by the volts. However, don't use the 12V figure. That's because it's the nominal or named voltage. It's not the. To determine the size of the charge controller, divide the total watts your solar array or panel produces by the battery voltage. This will give you the amps the charge controller will need. Yes, increasing amps or current increases the power output (watts). However, it also increases the required wire size to prevent overheating. With large.
