

The principle and function of thermal energy panels

Overview

The basic principle of solar thermal heating is to utilize the sun's energy and convert it into heat which is then transferred into your home or business heating system in the form of hot water and space heating. The main source of heat generation is through roof mounted solar panels which are used in conjunction with a boiler. The collector is the main component of a solar thermal system and would in most cases be installed on the roof of the property. The collector contains specially coated reinforced glass pipes to capture the radiation emitted from. It is a common misconception that the climate of the United Kingdom makes it unsuitable for the use of solar technology. Solar collectors do not require bright sunlight in order to. The main ideal application for this technology would be in a residential setting where there is a need to reduce a large energy bill although.
