

What are the types of lead-acid batteries for electric vehicles

Overview

A lead-acid battery is the traditional type of battery used in most gasoline vehicles to start the engine. Beyond that, some of the earliest electric vehicles in the 90s, like the GM EV1 or the Ford Ranger EV, used lead-acid batteries. However, lead-acid batteries are no longer used by EV manufacturers because they're inefficient. After auto manufacturers phased out lead acid batteries, nickel metal hydride batteries were often used as an alternative. Some early electric vehicles fitted with nickel metal hydride batteries include the Honda EV. Most electric vehicles nowadays use lithium-ion batteries. This is because they're lightweight with high energy efficiency than lead acid or. Lithium-sulfur batteries are another alternative to lithium-ion batteries. Similar to solid-state batteries, lithium-sulfur batteries can deliver more range than lithium-ion batteries. They're also cheaper to produce with less. Solid-state batteries are currently in development, and they've not yet been used in electric vehicles. According to Toyota, the first electric vehicles with solid-state batteries could be on.
